Life Insurance Mathematics-Hans U. Gerber 2013-11-11 From the reviews: "The highly esteemed 1990 first edition of this book now appears in a much expanded second edition. The difference between the first two English editions is entirely due to the addition of numerous exercises. The result is a truly excellent book, balancing ideally between theory and practice.As already hinted at above, this book provides the ideal bridge between the classical (deterministic) life insurance theory and the emerging dynamic models based on stochastic processes and the modern theory of finance. The structure of the bridge is very solid, though at the same time pleasant to walk along. I have no doubt that Gerber's book will become the standard text for many years to come. *Metrika*, 44, 1996, 2

The Cinema of Latin America-Alberto Elena 2004-03-24 The Cinema of Latin America is the first volume in the new 24 Frames series of studies of national and regional cinema. In taking an explicitly text-centered approach, the books in this series offer a unique way of considering the particular concerns, styles and modes of representation of numerous national cinemas around the world. This volume focuses on the vibrant practices that make up Latin American cinema, a historically important regional cinema and one that is increasingly returning to popular and academic appreciation. Through 24 individual concise and insightful essays that each consider one significant film or documentary, the editors of this volume have compiled a unique introduction to the cinematic output of countries as diverse as Brazil, Argentina, Cuba, Mexico, Bolivia, Chile and Venezuela. The work of directors such as Luis Buñuel, Thomas Guitierrez Alea, Walter Salles, and Alfonso Arau is discussed and the collection includes in-depth studies of seminal works as such *Los Olvidados*, *The Hour of the Furnaces*, *Like Water For Chocolate*, *Foreign Land*, and *Amoros Perros*.

Applied Survival Analysis Using R-Dirk F. Moore 2016-05-11 Applied Survival Analysis Using R covers the main principles of survival analysis, gives examples of how it is applied, and teaches how to put those principles to use to analyze data using R as a vehicle. Survival data, where the primary outcome is time to a specific event, arise in many areas of biomedical research, including clinical trials, epidemiological studies, and studies of animals. Many survival methods are extensions of techniques used in linear regression and categorical data, while other aspects of this field are unique to survival data. This text employs numerous actual examples to illustrate survival curve estimation, comparison of survivals of different groups, proper accounting for censoring and truncation, model variable selection, and residual analysis. Because explaining survival analysis requires more advanced mathematics than many other statistical topics, this book is organized with basic concepts and most frequently used procedures covered in earlier chapters, with more advanced topics near the end and in the appendices. A background in basic linear regression and categorical data analysis, as well as a basic knowledge of calculus and the R system, will help the reader to fully appreciate the information presented. Examples are simple and straightforward while still illustrating key points, shedding light on the application of survival analysis in a way that is useful for graduate students, researchers, and practitioners in biostatistics.

The Conservation of Plant Biodiversity-Otto Herzberg Frankel 1995-09-21 Discusses the various options for conserving plants at the level of the gene, species and community.

Developing Students' Statistical Reasoning-Joan Garfield 2008-09-08 Increased attention is being paid to the need for statistically educated citizens: statistics is now included in the K-12 mathematics curriculum, increasing numbers of students are taking courses in high school, and introductory statistics courses are required in college. However, increasing the amount of instruction is not sufficient to prepare statistically literate citizens. A major change is needed in how statistics is taught. To bring about this change, three dimensions of teacher knowledge need to be addressed: their knowledge of statistical content, their pedagogical knowledge, and their statistical-pedagogical knowledge, i.e., their specific knowledge about how to teach statistics. This book is written for mathematics and statistics educators and researchers. It summarizes the research and highlights the important concepts for teachers to emphasize, and shows the interrelationships among concepts. It makes specific suggestions regarding how to build classroom activities, integrate technological tools, and assess students' learning. This is a unique book. While providing a wealth of examples through lessons and data sets, it is also the best attempt by members of our profession to integrate suggestions from research findings with statistics concepts and pedagogy. The book's message about the importance of listening to research is loud and clear, as is its message about alternative ways of teaching statistics. This book will impact instructors, giving them pause to consider: "Is what I'm doing now really the best thing for my students? What could I do better?" J. Michael Shaughnessy, Professor, Dept of Mathematical Sciences, Portland State University, USA This is a much-needed text for linking research and practice in teaching statistics. The authors have provided a comprehensive overview of the current state-of-the-art in statistics education research. The insights they have gleaned from the literature should be tremendously helpful for those involved in teaching and researching introductory courses. Randall E. Groth, Assistant Professor of Mathematics Education, Salisbury University, USA

Biology, Productivity and Bioenergy of Timber-Yielding Plants-Maginot Ngangyo Heya 2017-09-08 Face to the current global energy crisis, there is an urgent necessity of searching for alternatives to fossil fuels, and this book shows how timber is a promising resource for sustainable energy production. Northeast Mexico represents an important forest resource to satisfy the needs of the population in these areas. In order to harness these forest resources, technology for exploring these valuable resources must be developed. These technologies (with special reference to biology and wood technologies) are available in scattered form in a few books but there is no central, comprehensive source for practical forest scientists for adopting efficient forest management, practice, and exploration. This book deals with the characterization of the vegetation, morphology, phenological development, biomass production (leaf, litter, wood), and bioenergy of some timber-yielding species of Northeast Mexico, which will serve as a guide to study timber-yielding plants in the native vegetation of Tamaulipan thornscrub and experimental plantations. This includes morphology, vegetation cover, biomass production in terms of volume leaf biomass, litter, and volume of fire wood and timber. Special emphasis is given to the estimation of bioenergy products and chemical composition (Ph, extractable lignin, and inorganic elements). Large variations exist in vegetation cover, morphology, phenological development, biomass production of leaf and litter, volume of wood and various variable of bioenergy products among the selected species. The maximum production was found in summer and the volume of the harvestable timber was obtained in experimental plantations. This book, therefore, will serve as a practical handbook to characterize timber-yielding plants, which will help to efficiently manage forestry resources.

Log 33-Cynthia C. Davidson 2015-02-12 [Winter 2015] Log 33 delivers emerging currents and renewed interests in architectural thought. Log 31-Cynthia Davidson 2014-06-16 [Spring / Summer 2014] New Ancients recognizes the sudden reappearance of history in the work of an emerging group of architects, curators, theorists, and, of course, historians. Drawing a parallel with the 17th-century quarrel between the Ancients and Moderns at the Academie française, guest editors Dora Epstein Jones and Bryony Roberts present the work of practitioners who explore the contemporary possibilities of history. This Spring/Summer 2014 issue

particularly emphasizes drawing that synthesizes technology and precedent, including a Piranesi-inspired digital reimagining of Istanbul and an animated analytic drawing of Borromini's San Carlo alle Quattro Fontane linked via a QR code in the magazine.

Tree Breeding: Principles and Strategies-Gene Namkoong 2012-12-06 It has become apparent, during discussions with students and colleagues in forest genetics, that a universal concern is the achievement of diverse goals of forestry from fiber production in industrial as well as farm forests to conserving forest ecosystems. Although we generally have several breeding methods available and several species to breed, we seek to satisfy multiple-use goals on diverse sites by management techniques that at best can only partially control edaphic environmental variation. The dominant approach, which was agriculturally motivated, has involved intensive effort with complicated breeding plans on single species for uniform adaptability and single-product plantations. However, this is obviously neither the only, nor necessarily the best, solution for the genetic management of tree species, and thus our intent in this volume is to develop ways to achieve multiple objectives in tree breeding. We include an array of breeding plans from simple iterated designs to sets of multiple populations capable of using gene actions for different traits in different environments for uncertain futures. The presentation is organized around the development of breeding from single-to multiple-option plans, from single to multiple traits, from single to multiple environments, and from single to multiple populations. However, it is not a complete "How To" book, and includes neither exercises nor instructions on data handling. It also does not include discussion of all modes of reproduction and inheritance encountered in plants.

Logic as Algebra-Paul Halmos 2019-01-30 Here is an introduction to modern logic that differs from others by treating logic from an algebraic perspective. What this means is that notions and results from logic become much easier to understand when seen from a familiar standpoint of algebra. The presentation, written in the engaging and provocative style that is the hallmark of Paul Halmos, from whose course the book is taken, is aimed at a broad audience, students, teachers and amateurs in mathematics, philosophy, computer science, linguistics and engineering; they all have to get to grips with logic at some stage. All that is needed.

Blizzards-Mary B. Woods 2008-01-01 A winter snowfall can be beautiful. But if conditions call for dense snow, freezing temperatures, and bone-chilling wind, you are in for a dangerous blizzard. These blinding, swirling storms can shut down roads and damage buildings. Violent winds can thrash vehicles driving on icy roads. Snowdrifts can pile up to block streets or even cover houses. Blizzards can knock out power and threaten the lives of people stranded inside for days—or worse, those caught outside in the storm. With dramatic images and first-hand survivor stories—plus the latest facts and figures—this book shows you blizzard disasters up close.

Derivatives Markets-Robert Lynch McDonald 2006 To be financially literate in today's market, business students must have a solid understanding of derivatives concepts and instruments and the uses of those instruments in corporations. The Second Edition has an accessible mathematical presentation, and more importantly, helps students gain intuition by linking theories and concepts together with an engaging narrative that emphasizes the core economic principles underlying the pricing and uses of derivatives.

Tools for Computational Finance-Rüdiger U. Seydel 2012-03-09 The disciplines of financial engineering and numerical computation differ greatly, however computational methods are used in a number of ways

across the field of finance. It is the aim of this book to explain how such methods work in financial engineering; specifically the use of numerical methods as tools for computational finance. By concentrating on the field of option pricing, a core task of financial engineering and risk analysis, this book explores a wide range of computational tools in a coherent and focused manner and will be of use to the entire field of computational finance. Starting with an introductory chapter that presents the financial and stochastic background, the remainder of the book goes on to detail computational methods using both stochastic and deterministic approaches. Now in its fifth edition, *Tools for Computational Finance* has been significantly revised and contains: A new chapter on incomplete markets which links to new appendices on Viscosity solutions and the Dupire equation; Several new parts throughout the book such as that on the calculation of sensitivities (Sect. 3.7) and the introduction of penalty methods and their application to a two-factor model (Sect. 6.7) Additional material in the field of analytical methods including Kim's integral representation and its computation Guidelines for comparing algorithms and judging their efficiency An extended chapter on finite elements that now includes a discussion of two-asset options Additional exercises, figures and references Written from the perspective of an applied mathematician, methods are introduced as tools within the book for immediate and straightforward application. A 'learning by calculating' approach is adopted throughout this book enabling readers to explore several areas of the financial world. Interdisciplinary in nature, this book will appeal to advanced undergraduate students in mathematics, engineering and other scientific disciplines as well as professionals in financial engineering.
